What's New in the?

The CPU meter is a free application that allows you to monitor the current CPU usage and provides several useful tools that allow you to make adjustments accordingly. The included controls allow you to quickly adjust the brightness and contrast of the display as well as alter the current status, but there are also more advanced features that can be activated by using the included bundled tool. The CPU Meter allows you to set a desired CPU usage level, view it in live time, and detect the CPU usage of multiple processes. Windows7 came with a new task called the windows task manager, which is a single window that allows a user to view a few different things about their system. It includes information such as the processes that are running, the RAM being used and the CPU and Memory utilization, among other things. The usage information and process list is easy to understand, however there is a 2nd line that adds some more information. Below the usage information, it shows you the amount of memory that is used by each process. This means that if you have 1 process running and it takes up 2GB of memory, then your usage would be $1/2 * 2 \text{ GB} = 2\text{GB}$ You can use this data to monitor what is making the system use more memory, which in turn can help you find a bottleneck in your system. While you can monitor CPU and Memory usage easily enough within the Windows Task Manager, there is another tool that you can use to do the same, called CPU Meter. This utility allows you to do much more than simply view CPU or Memory usage, it monitors the usage of your CPU or memory and provides the user with a dashboard with useful information. I've created a guide on how to configure the CPU Meter, providing information on how to get it to recognize the first program that is loaded on your PC, as well as how to configure it to monitor your CPU usage. How to Configure CPU Meter to Monitor Memory Usage CPU Meter supports monitoring both CPU and Memory usage, however the only thing that it cannot do is to record this data, which is why the memory line is shown at the bottom of the screen. To get this functionality, you will need to use the CPU Meter Monitor. You can also grab the information that is displayed by CPU Meter, however that can be a bit confusing as the CPU and Memory usage are displayed differently, and you may not realize that you are actually using more memory than you realize. To begin, open up
